“I was floored when I read my Navigenics results which found that my highest elevated risk condition (96-98%) was colon cancer - I have just been diagnosed with colon cancer. Had I known my genetic risk years ago, I may have been more proactive and caught it even earlier. The cost is a small price to pay to prolong your life, especially if you have young kids or a family to provide for. “

-Sempra finance employee, Female, 51

I b9g b9j #xw#f d q#e u b9j #shd f h#ri#p b9g 111

“There’s a condition that I have 16 times the risk of developing as compared to the general population: macular degeneration. When added to the fact this is the reason that my grandmother is currently going blind, I’m suddenly a very motivated participant in my own health. While it’s a scary risk number, I’m now positioned to have an impact on it, and I’m incredibly happy that I know about it.”

-Microsoft program manager, Male, 30

I b9g b9j #xw#f d q#e u b9j #shd f h#ri#p b9g 111

“For years, I experienced stomach problems that never went away. My sister encouraged me to get a Navigenics genetic test and my results showed I was at high risk of celiac disease. My doctor recommended I cut out gluten from my diet, and in the three weeks since I changed my eating habits, I’ve lost eight pounds and my stomach problems have disappeared.”

-Urgent care employee, Female, 23

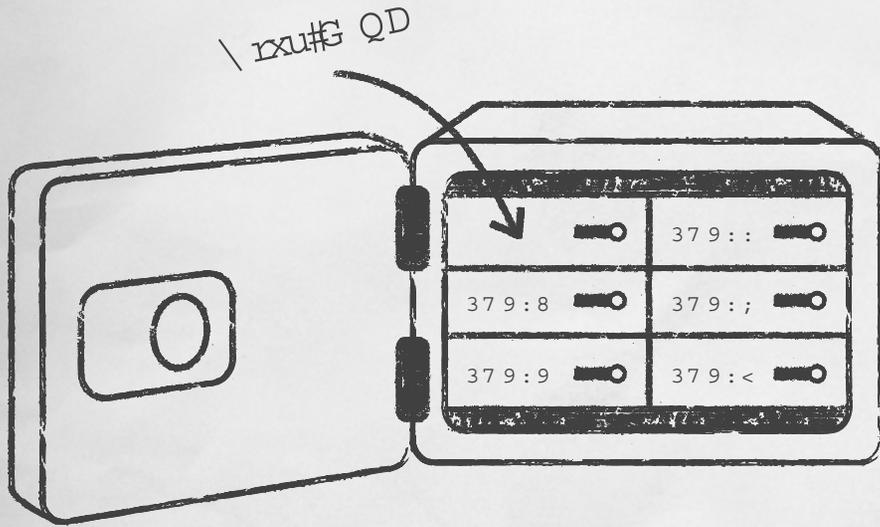

I b_gg b_jj #xw#f d q#e u b_jj #shd f h#ri#p b_gg 111

“My analysis was mostly reassuring, but showed two areas of increased risk. One was celiac disease, which was a surprise. I followed up the Navigenics report with a serologic test and an upper endoscopy, which were positive for moderately severe celiac disease. It is amazing to me, at the age of 52 years, and being a physician, that my diagnosis and treatment was possible only because of your DNA test.”

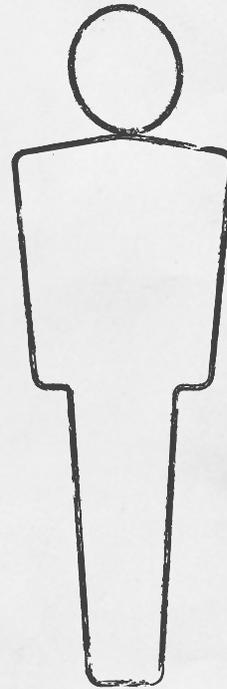

-Head of oncology company, Male, 52
